

# Physics 121

## Mid-Term Exam I Fall Semester (2022-2023)

October 29, 2022  
Time: 15:00 – 16:30

Student's Name: ..... Serial No: .....

Student's Number: ..... Section No: .....

**Instructors:** Drs. Ali, Alotaibi, Alsmadi, Hadjhour, Kokkalis, Razee

### Important Instructions to the Students:

1. Answer all questions and problems.
2. Full mark = 28 points as arranged in the table below.
3. No solution = no points.
4. Use SI units.
5. Take  $g = 9.8 \text{ m/s}^2$ .
6. Mobiles are **strictly prohibited** during the exam.
7. Programmable calculators, which can store equations, are not allowed.
8. Cheating incidents will be processed according to the university rules.

### For use by Instructors only

#	P1	P2	P3	P4	P5	P6	P7	Total
	4	4	4	3	5	3	5	28
Pts								

GOOD LUCK

- P1.** A cat moves along a straight line from point  $A$  to point  $B$  and then turns back to point  $C$ , as shown in the figure. The distance between points  $A$  and  $C$  is 5.0 m, and between points  $B$  and  $C$  is 10.0 m. The entire motion took 15.0 s.
- Find the average speed for the entire trip. (2 points)
  - Find the average velocity for the entire trip. (2 points)

Taking positive  $x$ -axis to the east and origin at point  $A$ .

$$(a) \text{ Average speed} = \frac{\text{total distance}}{\text{time}} = \frac{25}{15} = 1.67 \frac{\text{m}}{\text{s}}$$

$$(b) \text{ Average velocity} = \frac{\text{displacement}}{\text{time}} = \frac{-5-0}{15} = -0.3 \frac{\text{m}}{\text{s}}$$

- P2.** A rock is thrown vertically upward from the roof of a 36.0 m tall building (point  $A$ ), with an initial speed of 12.0 m/s. Ignore air resistance.
- Find the time takes the rock to reach its maximum height (point  $B$ ). (2 points)
  - Find the velocity of the rock at point  $C$ , located 10.0 m above ground. (2 points)

Taking positive  $y$ -axis upwards and origin at the ground:

$$a. v = v_0 + at \rightarrow 0 = 12 + (-9.8)t \rightarrow t = 1.2 \text{ s}$$

$$b. v^2 = v_0^2 + 2a(y - y_0) = 12^2 + 2(-9.8)(10 - 36) = 653.6 \rightarrow v = -25.6 \frac{\text{m}}{\text{s}}$$

**P3.** Vectors with magnitudes  $A = 6.0$  units and  $B = 4.0$  units, are shown. Vector  $\vec{C}$  is given by the equation  $\vec{C} = 2\vec{A} + \vec{B}$ .

a. Find the magnitude of vector  $\vec{C}$ .

**(3 points)**

b. Find the direction of vector  $\vec{C}$ , with respect to the positive  $x$ -axis.

**(1 point)**

$$C_x = 2A_x + B_x = (2)(-6)\sin(60) + 4\sin(30) = -8.4 \text{ units} \quad (1 \text{ point})$$

$$C_y = 2A_y + B_y = (2)(6)\cos(60) - 4\cos(30) = 2.5 \text{ units} \quad (1 \text{ point})$$

$$C = \sqrt{C_x^2 + C_y^2} = 8.8 \text{ units} \quad (1 \text{ point})$$

$$\theta' = \tan^{-1} \left| \frac{2.5}{8.4} \right| = 16.6 \rightarrow \theta = 180^\circ - 16.6^\circ = 163.4^\circ \quad (1 \text{ point})$$

**P4.** A 1200 kg car is travelling initially with constant speed of 120 km/h. The driver hits the break and stops completely over a distance of 65 m.

a. Find the acceleration of the car, assuming that is uniform.

**(2 points)**

b. Find the net force needed to bring the car to a complete stop.

**(1 point)**

$$v_0 = 120 \frac{\text{km}}{\text{h}} = 33.3 \text{ m/s} \quad (1 \text{ point})$$

$$a = \frac{v_f^2 - v_0^2}{2d} = \frac{0 - 33.3^2}{2 \cdot 65} = -8.5 \text{ m/s}^2 \quad (1 \text{ point})$$

$$F = ma = -10,200 \text{ N} \quad (1 \text{ point})$$

**P5.** Two blocks of masses  $m_1 = 4.0$  kg and  $m_2 = 5.0$  kg are connected by a massless cord. A force of magnitude 40 N is pulling  $m_1$  as shown below, so that the system is uniformly accelerated to the east.

- Find the tension in the cord between the blocks. **(4 points)**
- Find the net force acting on  $m_2$ . **(1 point)**

Taking positive  $x$ -axis to the east and positive  $y$ -axis upwards:

a.

$m_1$ :

$x$  - axis

$$F \cos(30) - F_T = F \cos(30) - F_T = m_1 a \quad (\text{Eq. 1})$$

**(1 point)**

$m_2$ :

$x$  - axis

$$F_T = m_2 a \quad (\text{Eq. 2})$$

**(1 point)**

$$\text{From Eqs (1) \& (2): } a = \frac{F \cos(30)}{m_1 + m_2} = 3.8 \frac{m}{s^2}$$

**(1 point)**

$$(\text{Eq. 2}) F_T = m_2 a \rightarrow F_T = 5 \times 3.8 = 19 \text{ N}$$

**(1 point)**

$$\text{b. } F_{net 2} = m_2 a = 5 \times 3.8 = 19 \text{ N}$$

**(1 point)**

Model Answers

**P6.** A 55.0 kg man is standing on a scale inside an elevator that is uniformly accelerated upwards with  $a = 1.2 \text{ m/s}^2$ .

- What is the reading on the scale (in kg)? **(2 points)**
- Starting from rest at the ground floor, how long it will take for the elevator to move 50 m upwards? **(1 point)**

Taking positive  $y$ -axis upward and origin at the ground floor.

$$F_N - mg = ma \rightarrow F_N = mg + ma = 605 \text{ N} \rightarrow \text{Scale reading is } 62.7 \text{ kg} \quad \text{(2 points)}$$

$$y = y_0 + v_0 t + \frac{1}{2} a t^2 \rightarrow 50 = 0 + 0 + \frac{1}{2} \times 1.2 \times t^2 \rightarrow t = 9.1 \text{ s} \quad \text{(1 point)}$$

**P7.** Two blocks with masses  $m_A = 15.0 \text{ kg}$  and  $m_B$  are connected through a frictionless and massless pulley by a lightweight cord. A force of magnitude 88.2 N is applied on  $m_A$  as shown.

- Draw the free body diagram for mass  $m_A$ . **(1 point)**
- Find the value of  $m_B$ , so that the system remains at rest. **(4 points)**

a.

**(1 point)**

b.

Taking positive  $x$ -axis to the east and positive  $y$ -axis upward for both masses:

The system remains at rest, and therefore  $a = 0 \text{ m/s}^2$ .

**(1 point)**

$x$  – axis

$$F_T - F = 0$$

(Eq. 2)

**(1 point)**

$m_B$ :

$y$  – axis

$$F_T - m_B g = 0$$

(Eq. 3)

**(1 point)**

From Eqs (2) & (3):  $F = m_B g \rightarrow m_B = \frac{F}{g} = \frac{88.2}{9.8} \rightarrow m_B = 9.0 \text{ kg}$

**(1 point)**
