

**Physics 102**  
**First Midterm Exam**  
**Summer Semester 2022/23**  
**June 24, 2023**

**Time: 11:30 – 1:00 p.m.**

Name..... Student No.....

Section No..... Serial No.....

Instructors: Drs. Al-Failakawi, Hadipour, & Lajko

**Fundamental constants**

$$k = \frac{1}{4\pi\epsilon_0} = 9.0 \times 10^9 \text{ N.m}^2 / \text{C}^2$$

(Coulomb constant)

$$\epsilon_0 = 8.85 \times 10^{-12} \text{ C}^2 / (\text{N} \cdot \text{m}^2)$$

(Permittivity of free space)

$$\mu_0 = 4\pi \times 10^{-7} \text{ T} \cdot \text{m/A}$$

(Permeability of free space)

$$|e| = 1.60 \times 10^{-19} \text{ C}$$

(Elementary unit of charge)

$$N_A = 6.02 \times 10^{23}$$

(Avogadro's number)

$$g = 9.8 \text{ m/s}^2$$

(Acceleration due to gravity)

$$m_e = 9.11 \times 10^{-31} \text{ kg}$$

(Electron mass)

$$m_p = 1.67 \times 10^{-27} \text{ kg}$$

(Proton mass)

**Prefixes of units:**

$$m = 10^{-3}$$

$$\mu = 10^{-6}$$

$$n = 10^{-9}$$

$$p = 10^{-12}$$

$$k = 10^3$$

$$M = 10^6$$

$$G = 10^9$$

$$T = 10^{12}$$

**For use by Instructors only**

Marks									

Ques.	1	2	3	4	5	6	7	8	Total
Marks									

**Important:**

1. Mobiles or other electronic devices are **strictly prohibited** during the exam.
2. Programmable calculators, which can store equations, are not allowed.
3. **Cheating incidents will be processed according to the university rules.**

**Part I. Solve the following problems. Show your solutions in detail.**

1. Three point charges  $q_1 = -4 \mu\text{C}$ ,  $q_2 = q_3 = 4 \mu\text{C}$  are placed to the vertices of a right-angled triangle, as shown. Calculate the  $x$  and  $y$  components of the net electric force  $\vec{F}_2$  acting on  $q_2$ . **[4 points]**

$$r_{12} = \sqrt{(0.4\text{m})^2 + (0.4\text{m})^2} = 0.566 \text{ m}$$

$$F_{2,x} = F_{13,x} + F_{23,x} = -k \frac{|q_1 q_2|}{r_{12}^2} \cos(45^\circ) + k \frac{|q_2 q_3|}{r_{23}^2} = 0.582 \text{ N}$$

$$F_{2,y} = F_{13,y} + F_{23,y} = -k \frac{|q_1 q_3|}{r_{13}^2} \sin(45^\circ) = -0.318 \text{ N}$$

2. A particle of charge  $q = -4 \mu\text{C}$  and mass  $m = 2 \times 10^{-6} \text{ kg}$  moves with initial velocity  $\vec{v} = 2 \times 10^2 \left(\frac{\text{m}}{\text{s}}\right) \hat{i}$  into a region of uniform electric field  $\vec{E} = 1200 \left(\frac{\text{N}}{\text{C}}\right) \hat{j}$ . If the particle's path is bent as shown in the figure and  $L = 2.0 \text{ m}$ , determine the displacement  $\Delta y$ . **[4 points]**

$$F = qE = ma \Rightarrow a = \frac{qE}{m} = 2400 \text{ m/s}^2$$

$$t = \frac{L}{v} \Rightarrow t = 0.01$$

$$\Delta y = -a \frac{t^2}{2}$$

$$\Delta y = -0.12 \text{ m}$$

3. Charge  $Q = 60 \text{ nC}$  is uniformly distributed along a rod of length  $L = 3.0 \text{ m}$  fixed on the  $y$ -axis, as shown.

Calculate the net electric field vector  $\vec{E}_A$  at point  $A$ . Given  $a = 0.3 \text{ m}$  and  $b = 0.4 \text{ m}$ . [5 points]

$$d\vec{E}_A = \frac{k dQ}{r^2} (-\hat{j}) = \frac{k \lambda dy}{(y+b)^2} (-\hat{j}) \quad ; \quad \lambda = \frac{dQ}{dL} = \frac{Q}{L}$$

$$\vec{E}_A = \int_{\text{source}} d\vec{E}_A = - \int_a^{L+a} \frac{k \lambda dy}{(y+b)^2} \hat{j} = -k \lambda \left[ -\frac{1}{y+b} \right]_a^{L+a} \hat{j} =$$

$$\vec{E}_A = -208.5 \frac{\text{N}}{\text{C}} \hat{j}$$

4. A sphere of radius  $a = 4.0 \text{ cm}$  has uniform volume charge density  $\rho_1 = +30.0 \text{ nC/m}^3$  and a concentric spherical shell of inner radius  $a$ , outer radius  $b = 8.0 \text{ cm}$  has uniform volume charge density  $\rho_2 = -15.0 \text{ nC/m}^3$ . Find the net electric field (magnitude and direction (inward or outward)) at a distance  $r = 12.0 \text{ cm}$  from the center point. [4 points]

Gauss's Law:

$$\oint \vec{E} \cdot d\vec{A} = \frac{Q_{\text{encl}}}{\epsilon_0}$$

$$E(4\pi r^2) = \frac{Q_{\text{encl}}}{\epsilon_0}$$

$$Q_{\text{encl}} = \rho_1 \left( \frac{4}{3} \pi a^3 \right) + \rho_2 \left( \frac{4}{3} \pi (b^3 - a^3) \right)$$

$$E(4\pi r^2) = \frac{\rho_1 \left( \frac{4}{3} \pi a^3 \right) + \rho_2 \left( \frac{4}{3} \pi (b^3 - a^3) \right)}{\epsilon_0} \Rightarrow E = -12.6 \frac{\text{N}}{\text{C}}, \text{ inward}$$

5. A large sheet with uniform surface charge density  $\sigma_1 = 8 \text{ nC/m}^2$  is placed perpendicular to the  $x$ -axis and another large sheet with uniform surface charge density  $\sigma_2 = 4 \text{ nC/m}^2$  is perpendicular to the  $y$ -axis, as shown. Find the net electric field  $\vec{E}$  at point A and its direction relative to the positive  $x$ -axis. [4 points]

$$\vec{E}_{net} = \vec{E}_{1,A} + \vec{E}_{2,A} = \frac{\sigma_1}{2\epsilon_0} \hat{i} + \frac{\sigma_2}{2\epsilon_0} \hat{j}$$

$$\vec{E}_{net} = 452 \frac{\text{N}}{\text{C}} \hat{i} + 226 \frac{\text{N}}{\text{C}} \hat{j}$$

$$\theta = \tan^{-1} \left[ \frac{E_{net,y}}{E_{net,x}} \right] = 26.6^\circ$$

6. A spherical surface of radius  $R = 0.5 \text{ m}$  has charge  $Q = 10 \text{ nC}$  uniformly distributed on it and a point charge  $q$  is at its center. Take  $V = 0$  at infinity. If the electric potential at point B is  $0 \text{ V}$ , what is the electric potential at point A? Given  $r_A = 0.25 \text{ m}$  and  $r_B = 1.0 \text{ m}$ . [4 points]

$$V_B = V_{qB} + V_{QB} = 0 = k \frac{q}{r_B} + k \frac{Q}{r_B} \Rightarrow$$

$$q = -Q = -10 \text{ nC}$$

$$V_A = V_{qA} + V_{QA} = k \frac{q}{r_A} + k \frac{Q}{R} = -180 \text{ V}$$

7. Three point charges are  $q_1 = -2 \mu\text{C}$ ,  $q_2 = q_3 = 4 \mu\text{C}$  are fixed at vertices of a right-angled triangle, as shown. If the electric potential energy of the point charge  $q_1$  is  $U(q_1) = -2 \text{ J}$ , what is the total potential energy of the system. **[4 points]**

$$U(q_1) = k \frac{q_1 q_2}{0.6a} + k \frac{q_1 q_3}{0.8a} = -2 \text{ J} \Rightarrow a = 0.105 \text{ m}$$

$$\text{hypotenuse} = \sqrt{(0.8a)^2 + (0.6a)^2} = a$$

$$U_{tot} = k \frac{q_1 q_2}{0.6a} + k \frac{q_1 q_3}{0.8a} + k \frac{q_2 q_3}{a} = -0.63 \text{ J}$$

8. Two point charges,  $q_1 = q_2 = 2 \mu\text{C}$ , with identical masses,  $m_1 = m_2 = 4 \text{ g}$ , are released simultaneously from rest at a distance  $a = 0.5 \text{ m}$ , as shown. What is the speed of  $q_1$  when it is at a distance  $b = 1.5 \text{ m}$  from  $q_2$ ? **[3 points]**

*The mechanical energy conservation:*

$$E_{in} = E_{fin} \Rightarrow U_{in} = U_{fin} + K_{fin}$$

$$k \frac{q_1 q_2}{a} = k \frac{q_1 q_2}{b} + 2 \frac{mv^2}{2} \Rightarrow k q_1 q_2 \left( \frac{1}{a} - \frac{1}{b} \right) = mv^2$$

$$v = \sqrt{\frac{k q_1 q_2}{m} \left( \frac{1}{a} - \frac{1}{b} \right)} = 3.46 \text{ m/s}$$

**Part II. Multiple choice questions (each carries 1 point). Tick the best answer:**

1. Three identical metal spheres  $A$ ,  $B$ , and  $C$  are initially uncharged and separated. Then sphere  $A$  is charged with  $40 \mu\text{C}$  and spheres  $A$  and  $B$  are touched together and then separated. Sphere  $C$  is then touched to sphere  $B$  and separated from it. What is the final charge of sphere  $C$ ?

- a)  $40 \mu\text{C}$ .
- b)  $20 \mu\text{C}$ .
- c)  $10 \mu\text{C}$ .
- d)  $0$ .

2. The arc in the figure is uniformly charged as shown. The direction of the net electric field at the origin is

- a)  $+\hat{i} + \hat{j}$ .
- b)  $-\hat{i} - \hat{j}$ .
- c)  $+\hat{i} - \hat{j}$ .
- d)  $-\hat{i} + \hat{j}$ .

3. A charged ring of radius  $a$  is placed along the  $x$ -axis as shown. At which point is the magnitude of the electric field smallest?

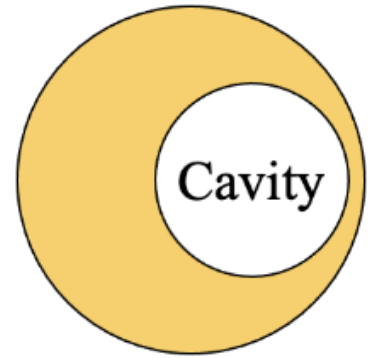

- a)  $A$ .
- b)  $B$ .
- c)  $C$ .
- d)  $D$ .

4. If  $E$  is the magnitude of electric field at a distance  $r = \frac{R}{4}$  from the center of a uniformly charged non-conducting sphere of radius  $R$ , the magnitude of electric field at a distance  $R$  from the center of the sphere is

- a)  $0$ .
- b)  $E$ .
- c)  $2E$ .
- d)  $4E$ .

5. A solid spherical conductor has a spherical cavity, as shown. If there is a net positive charge on the outer surface of the conductor, the electric field in the cavity

- a) points generally from the center of the conductor towards the outer surface of the cavity.
- b) points generally from the outer surface of the conductor toward the center of the cavity.
- c) is zero. ←
- d) points from the center of the cavity toward the center of the conductor.

6. The straight lines 1, 2, and 3 represent the electric field lines, and the curved lines marked 4, 5, and 6 represent the equipotential surfaces, as shown. A charge  $q$  follows the path  $A \rightarrow B \rightarrow C \rightarrow D$ . The work done on the charge by the electric field is

- a)  $W_E > 0$ , if  $q$  is positive
- b)  $W_E < 0$ , if  $q$  is positive
- c)  $W_E < 0$ , if  $q$  is negative.
- d)  $W_E = 0$ . ←

7. Which of the following is the unit of the energy?

- a)  $V \cdot C$ . ←
- b)  $N \cdot C/m$ .
- c)  $J/C$ .
- d)  $V/C$ .

8. Two point charges are placed along the  $x$ -axis, as shown. If the electric potential is positive at point  $P$ , relative to  $V = 0$  at infinity, which statement is correct for the charges?

- a)  $q_1 = q_2$ .
- b)  $q_1 = -q_2$ .
- c)  $q_1 + q_2 > 0$ . ←
- d)  $q_1 + q_2 < 0$ .
